induction" and conduction", of which the second is the most direct and readily effective.

Now, let us proceed. In the present instance, if it is assumed that I appeared to serve for the charged medium, from whom power was transmitted to the nearest i.e., my friend in question, it may be asked, whether transmission was by the first process i.e., induction, or by the second i.e., conduction* In answer, I have to say, that at the very first, when I called my friend from where I found him, I went and caught hold of him by one of his arms and brought him to the corner where I began the scolding. So it follows, that if I happened to have been charged from the very first, conduction could have taken place at the very beginning; moreover in the course of the discussion that followed between my friend and myself, it could not be denied, that I touched him now and again with iny fiands, but when the climax of it all came, *

Topping off the head in a whirlpool current of invisible yet visible fluid matter, there happened to have been no touch contact

between us. I
am inclined to infer from this, that transmission
took place by means of both the processes;
conduction having raised the electric condition
